car on general fatigue

#### PREVENTING DISASTER TO TROOP TRAINS.

When a troop (or other important train) is travelling through the enemy's country, great precaution is taken to guard against it being blown up or destroyed in some way. The method shown in our sketch is used. Two trucks, heavily loaded with worthless materials, are placed in front of the engine and act as a "dummy head." Should a mine, or explosive, be placed on the line, the trucks come into contact with it before the engine, and bear the brunt of the damage.

SUBMARINE MINES. The most deadly factor that has been introduced into modern naval warfare is the submarine mine. It is a small, cylindrical object, usually of the size of a tin can, and is laid out in a line or circle around a ship. It is connected to a mine field by a cable, and is electrically operated. The mine is usually set to explode when a ship passes over it, and is a most effective weapon.

THE OTHER VICTORIA CROSS. Did you know that there was another Victoria Cross—ever since that time given in our school? New Zealand has its own V.C. and it is given to those who have done "brave" deeds in their own right. This medal is given to those who have done "brave" deeds in their own right. This medal is given to those who have done "brave" deeds in their own right.

arrive here about  
dinnertime

**PENETRATION OF BULLETS.** When a defensive work of any kind is being made, it is necessary to remember that some substances offer more resistance than others. Neglect of this fact may lead to disaster, for instance, to throw up a breastwork of wood less than four feet thick would be useless, for that thickness of wood is the least that will stop a bullet. Brickwork must be nine inches to be proof, and earthwork at least three feet thick.
